

## Validate Stack Sequences [\(View\)](#)

Given two integer arrays `pushed` and `popped` each with distinct values, return `true` if this could have been the result of a sequence of push and pop operations on an initially empty stack, or `false` otherwise.

### Example 1:

**Input:** `pushed = [1,2,3,4,5]`, `popped = [4,5,3,2,1]`

**Output:** `true`

**Explanation:** We might do the following sequence:

`push(1)`, `push(2)`, `push(3)`, `push(4)`,

`pop()` -> 4,

`push(5)`,

`pop()` -> 5, `pop()` -> 3, `pop()` -> 2, `pop()` -> 1

### Example 2:

**Input:** `pushed = [1,2,3,4,5]`, `popped = [4,3,5,1,2]`

**Output:** `false`

**Explanation:** 1 cannot be popped before 2.

### Constraints:

- `1 <= pushed.length <= 1000`
- `0 <= pushed[i] <= 1000`
- All the elements of `pushed` are **unique**.
- `popped.length == pushed.length`
- `popped` is a permutation of `pushed`.
