Range Sum Query (View)

Given an integer array nums, handle multiple queries of the following types:

- 1. **Update** the value of an element in nums.
- Calculate the sum of the elements of nums between indices left and right inclusive where left <= right.

Implement the NumArray class:

- NumArray(int[] nums) Initializes the object with the integer array nums.
- void update(int index, int val) **Updates** the value of nums[index] to be val.
- int sumRange(int left, int right) Returns the sum of the elements of nums between indices left and right inclusive (i.e. nums[left] + nums[left + 1] + ... + nums[right]).

Example 1:

```
Input
["NumArray", "sumRange", "update", "sumRange"]
[[[1, 3, 5]], [0, 2], [1, 2], [0, 2]]
Output
[null, 9, null, 8]

Explanation
NumArray numArray = new NumArray([1, 3, 5]);
numArray.sumRange(0, 2); // return 1 + 3 + 5 = 9
numArray.update(1, 2); // nums = [1, 2, 5]
numArray.sumRange(0, 2); // return 1 + 2 + 5 = 8
```

Constraints:

```
• 1 <= nums.length <= 3 * 10^4
```

- -100 <= nums[i] <= 100
- 0 <= index < nums.length
- -100 <= val <= 100
- 0 <= left <= right < nums.length
- At most 3 * 104 calls will be made to update and sumRange.
