Flatten Nested List Iterator (View)

You are given a nested list of integers nestedList. Each element is either an integer or a list whose elements may also be integers or other lists. Implement an iterator to flatten it.

Implement the NestedIterator class:

- NestedIterator(List<NestedInteger> nestedList) Initializes the iterator with the nested list nestedList.
- int next() Returns the next integer in the nested list.
- boolean hasNext() Returns true if there are still some integers in the nested list and false otherwise.

Your code will be tested with the following pseudocode:

```
initialize iterator with nestedList

res = []
while iterator.hasNext()
    append iterator.next() to the end of res
return res
```

If res matches the expected flattened list, then your code will be judged as correct.

Example 1:

```
Input: nestedList = [[1,1],2,[1,1]]
Output: [1,1,2,1,1]
Explanation: By calling next repeatedly until hasNext returns false, the order of elements returned by next should be: [1,1,2,1,1].
```

Example 2:

```
Input: nestedList = [1,[4,[6]]]
Output: [1,4,6]
Explanation: By calling next repeatedly until hasNext returns false, the order of elements returned by next should be: [1,4,6].
```

Constraints:

- 1 <= nestedList.length <= 500
- The values of the integers in the nested list is in the range [-106, 106].
