First Unique Character in a String (View)

Given a string `s`, *find the first non-repeating character in it and return its index.* If it does not exist, return -1.

Example 1:

Input: s = "leetcode"

Output: 0

Example 2:

Input: s = "loveleetcode"

Output: 2

Example 3:

Input: s = "aabb"

Output: -1

Constraints:

- `1 <= s.length <= 10`^{5}
- `s` consists of only lowercase English letters.
